01

# Introduction of ju:niz Energy GmbH

## Core business

- Intelligent large-scale storage systems that are operated in a grid-serving and economical manner.
- Decentral energy supply of renewable energies, battery storage and hydrogen for district areas
- intelligent energy management systems that control both the battery storage systems and the decentral energy system for optimal use.

# Showcase of Generation 1.0 BESS

ju:niz

# Introduction to Generation 1.0 BESS

## Generation 1.0 BESS

- 25 Energy Storage plants across Germany
  - Starting capacity 150kwh
  - Average 1MWh capacity
  - Up to 11MWh capacity
- Using mainly Samsung NMC Batteries and “Second Life” Batteries with LMO

## Main Usage cases:

- Primary Frequency Control (Main Usage scenario)
- Peak Shaving
- Self-Supply for Electric Energy
- Reduction of Distribution Grid Fees

# Large-scale storage increases flexibility in the energy supply for industry/commerce and in the electricity grid

Frequency reserve and trading

Peak Shaving, Optimisation of own consumption, 7000h for industry and district areas

> 10 MWh

< 5 MWh

iEMS

Operational Services

# PRL-Speicher Garching near by Munich

## Key Facts

Customer	Forschungsprojekt
Location	Campus der Technischen Universität München
Completion	2016

## Technical Design

Power	1,4 MW
Capacity	1,2 MWh
System	Samsung SDI / Daimler
Design	40 ft Battery container Rectifier Transformer
EMS	Smart Power iEMS

# JUWI Schmölln - First German Innovation project “Wind Energy and Energy Storage”

## Key facts

Customer	Juwi
Location	Schmölln
Completion	2022

## Technical Design

Power	2,9 MW
Capacity	3 MWh
System	SAMSUNG SDI
Design	40 ft Battery container Rectifier
EMS	Smart Power iEMS

# SMAREG 1 - Smartbooster

## Key Facts

Customer	Investor project
Location	Gotha
Completion	2020

## Technical Design

Power	11 MW
Capacity	11 MWh
System	SAMSUNG SDI
Design	40 ft Battery container Rectifier Transformer Transfer station
EMS	Smart Power iEMS

# VWEW Leinau

## Key Facts

Customer	Industrial Customer
Location	Kaufbeuren
Completion	2021

## Technical Design

Power	7,3 MW
Capacity	3,7 MWh
System	SAMSUNG SDI
Design	20ft Battery container Rectifier Transformer
EMS	Smart Power iEMS

03

# Showcase of Generation 1.5 BESS

ju:niz

# Introduction to Generation 1.5 BESS

## Generation 1.5 BESS

- 7 Energy Storage plants across Germany
  - Starting capacity 11MWh
  - Average 23.7MWh capacity
  - Up to 67MWh capacity
  - Sum of 187.6MWh
- Using mainly Samsung NMC Batteries

## Main Usage cases:

- Primary Frequency Control (Main Usage scenario)
- Reduction of Distribution Grid Fees

# SMAREG4 – „Wartburgspeicher“

## Key Facts

Customer	Investor project
Location	Eisenach
Completion	2022

## Technical Design

Power	60 MW
Capacity	60 MWh
System	SAMSUNG SDI
Design	20x“Langhaus“ Design Rectifier Transformer
EMS	Smart Power iEMS

# SMAREG6 – „Gunzenhausen“

## Key Facts

Customer	Investor project
Location	Gunzenhausen
Completion	2023

## Technical Design

Power	24 MW
Capacity	24 MWh
System	SAMSUNG SDI
Design	2x Tripple „Langhaus“ Design Rectifier Transformer
EMS	Smart Power iEMS

## Overview – Historical Setup

ju:niz

# The Good Ol' Days

## **Centralised Monitoring Server:**

- Rented vServer as the main influxDB Cluster
- No working backup solution
- Limitation of resources
- No upgrade of hardware/performance possible (dead end)
- Ubuntu Server installations close to end of life

## **Limitations of the legacy solution**

- Unreliable syncing of data between Edge locations and centralised monitoring
- Due to Storage concerns, usage of retention policies to throw data out
- Due to throwing out data, analysis of the data is based on less precise information

## Limitations of the used InfluxDB OSS 1.x

### Features which were introduced with later influxDB OSS Versions

- Edge Data Replication: reliable way to sync data from Edge locations
- Flux Language: More flexible and powerful queries
- Integrated UI: Built-in dashboarding and alert management
- Tasks: Automated data processing without Kapacitor
- Token-based Auth: Enhanced security and access control
- Export/Import: Easier backup and restore options

05

# InfluxDB Cloud V1

ju:niz

# InfluxDB Cloud V1 – The begin of the journey

## Requirements

- More reliable server setup (simple failover functionality at least!)
- Implementation of snapshots and backups
- Prevention to delete data due to storage issues
- Getting a more reliable data sync into the cloud
- Migrate all existing data from self-hosted influxDB instances into Cloud instance

## Solution

- InfluxDB Cloud V1 Cluster – multiple node setup
- Implementation of Kapacitor Tasks to send data through Kapacitor to the influxDB Cloud
- Getting rid of storage issues or concerns

# The problems and bottlenecks

## Data Migration Headaches

- Due to the nature of our legacy infrastructure, using the influxDB OSS 2.x tools was not an option
- Importing the compressed line protocol exports took forever and failed a lot of times

## Getting data into the Cloud

- Kapacitor tasks are running like a cronjob – no “real time” data ingests
- Kapacitor is not sending data multiple times if it failed the first time

## Cluster load always spikes

- Cluster is having a hard time to keep up with the workload
- Even though **not** all legacy plants are ingesting data

# The problems and bottlenecks

06

# InfluxDB Cloud Dedicated

# The problems and bottlenecks

## Data Migration Headaches

- Normalization of inconsistent data since InfluxDB V3 doesn't support different data types per field
- Getting rid of legacy "retention" policies since storage isn't a concern anymore

## Getting data into the Cloud

- Using influxDB V2 write commands to send databases directly
- Running "inconsistent" databases through Telegraf to normalize the data
- Implementation of EDR for legacy plants

## Cluster load

- Cluster is **not** having a hard time to keep up with the workload anymore
- **All legacy plants are ingesting data now**

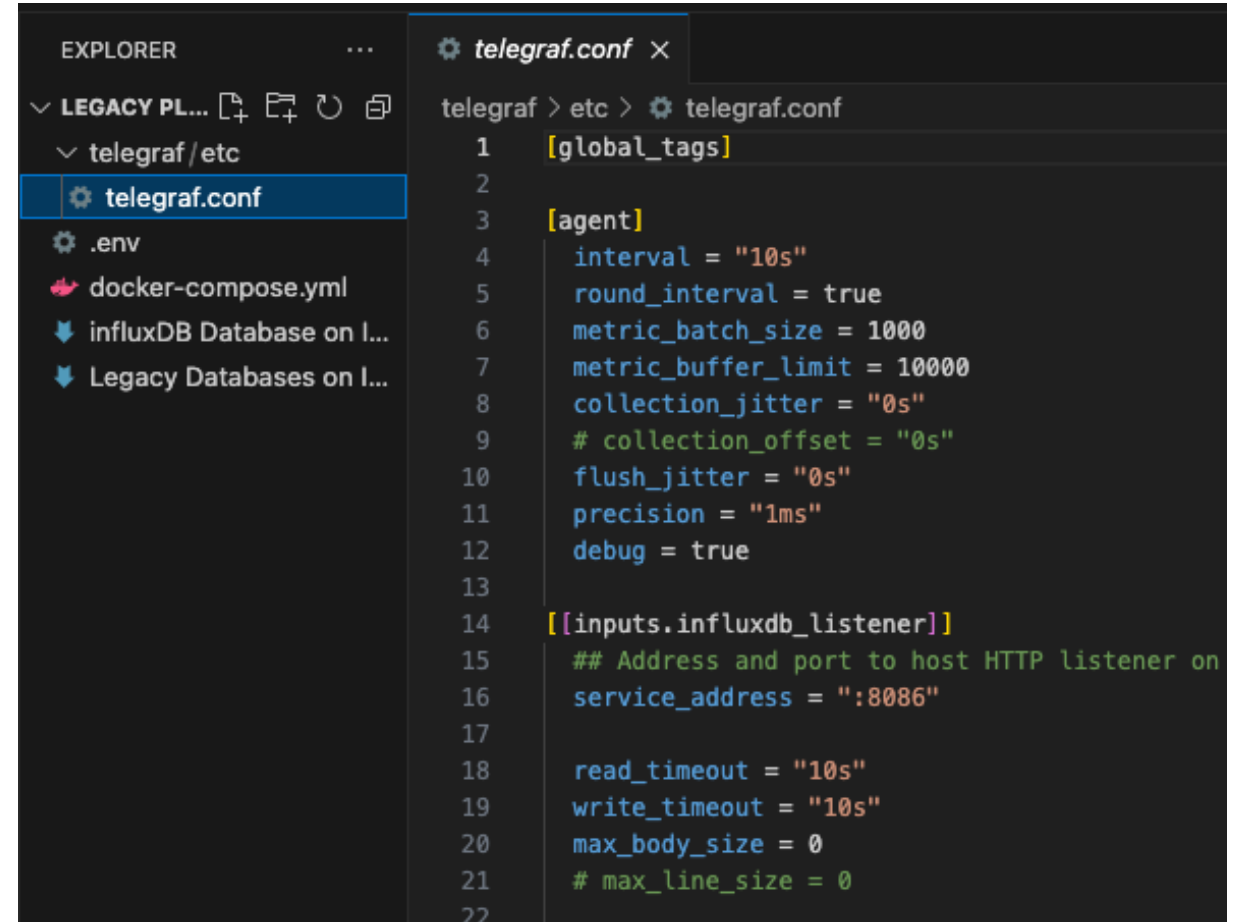

# Introduction of EDR to Gen 1.0 Plants

## Requirements

- More reliable transport from edge device data into cloud
- Avoiding to touch the actual plant control units, since touching the legacy scripts or SPS controls directly has a high risk potential of downtimes and interruptions
- Continuously data sending rather than getting data every 10mins
- Reliable mechanism to send back failed data

## Solution

- Docker Compose “Swiss Army Knife” Container Setup which allows parallel installation to current local influxDB OSS
- Telegraf plays an influxDB v1 Listener
- Transfers data into influxDB OSS 2.4 Container
- Using EDR from the new influxDB Database
- Allows to keep all legacy scripts in place and no need to touch SPS
- Old Monitoring Server still gets data until all customers are migrated to the new Grafana instance

```
telegraf > etc > telegraf.conf
1  [global_tags]
2
3  [agent]
4      interval = "10s"
5      round_interval = true
6      metric_batch_size = 1000
7      metric_buffer_limit = 10000
8      collection_jitter = "0s"
9      # collection_offset = "0s"
10     flush_jitter = "0s"
11     precision = "1ms"
12     debug = true
13
14     [[inputs.influxdb_listener]]
15         ## Address and port to host HTTP listener on
16         service_address = ":8086"
17
18         read_timeout = "10s"
19         write_timeout = "10s"
20         max_body_size = 0
21         # max_line_size = 0
22
```

07

# Gathering data with Telegraf from MQTT devices

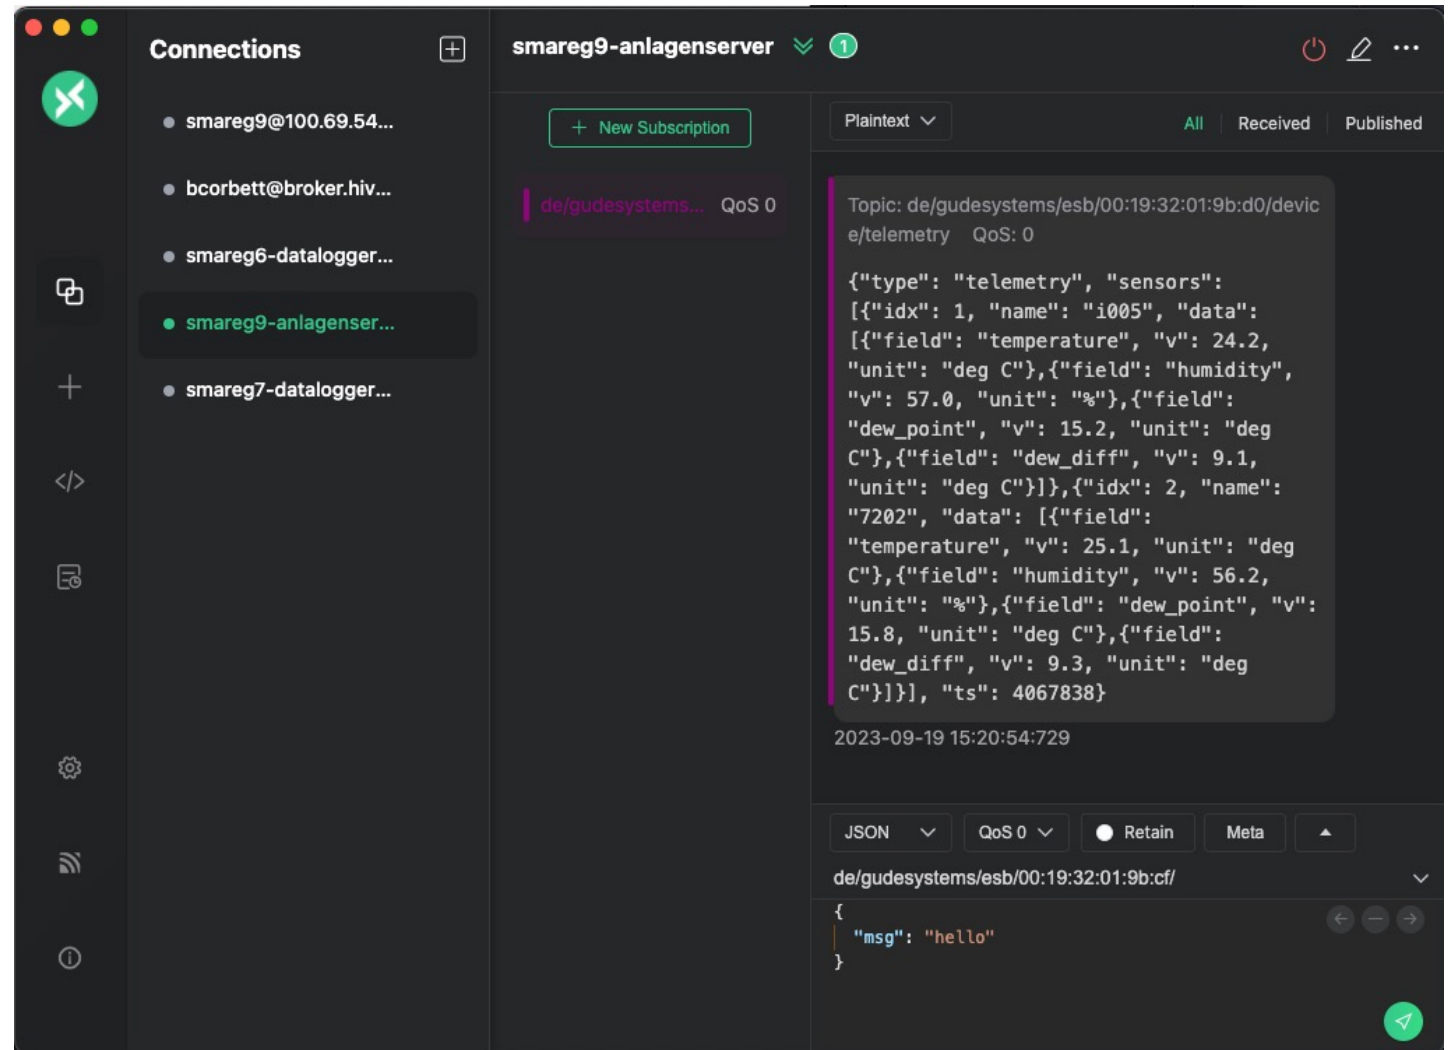

# Temporary temperature logging

## Requirements

- During construction time, final climate incl. all sensors are not yet working
- We need to have logging information about the temperatures and humidity for batteries
- Due to this being just temporary, the systems need to be implemented quickly with low costs

## Solution

- LAN Temperature Sensors which report data via MQTT
- Gathering the data from MQTT with Telegraf
- Sending the Telegraf data to local influxDB OSS
- Using EDR to send to InfluxDB Cloud Dedicated V3
- Add the database in Grafana for visualization and alerts

# Telegraf.conf file for getting the job done

## Telegraf Setup

- Define MQTT Consumer Input Plugin
- Define InfluxDB V2 Output Plugin
- Configure MQTT input plugin

## MQTT Input Plugin

- Set processing data format, i.e. "xpath\_json"
- Define the Metrics name and selection
- Define your field names and values

```
telegraf.conf
1
2 # Read metrics from MQTT topic(s)
3 [[inputs.mqtt_consumer]]
4     ## Broker URLs for the MQTT server or cluster. To connect to multiple
5     ## clusters or standalone servers, use a separate plugin instance.
6     ## example: servers = ["tcp://localhost:1883"]
7     ## servers = ["ssl://localhost:1883"]
8     ## servers = ["ws://localhost:1883"]
9     servers = ["tcp://127.0.0.1:1883"]
10
11     ## Topics that will be subscribed to.
12     topics = [
13         "de/gudesystems/esb+/device/#",
14         "sensors/#",
15     ]
16
17     ## more about them here:

# Grafana Visualization of temporary temperature logging

## Grafana Visualization

- Showing information about each device and sensor
- Adding the information to Dashboards
- Allows historical information checking

## Grafana Alerts

- Since plants in construction phase, are not actively in monitoring like “production plants” the alerts are important to notify about temperature/humidity issues

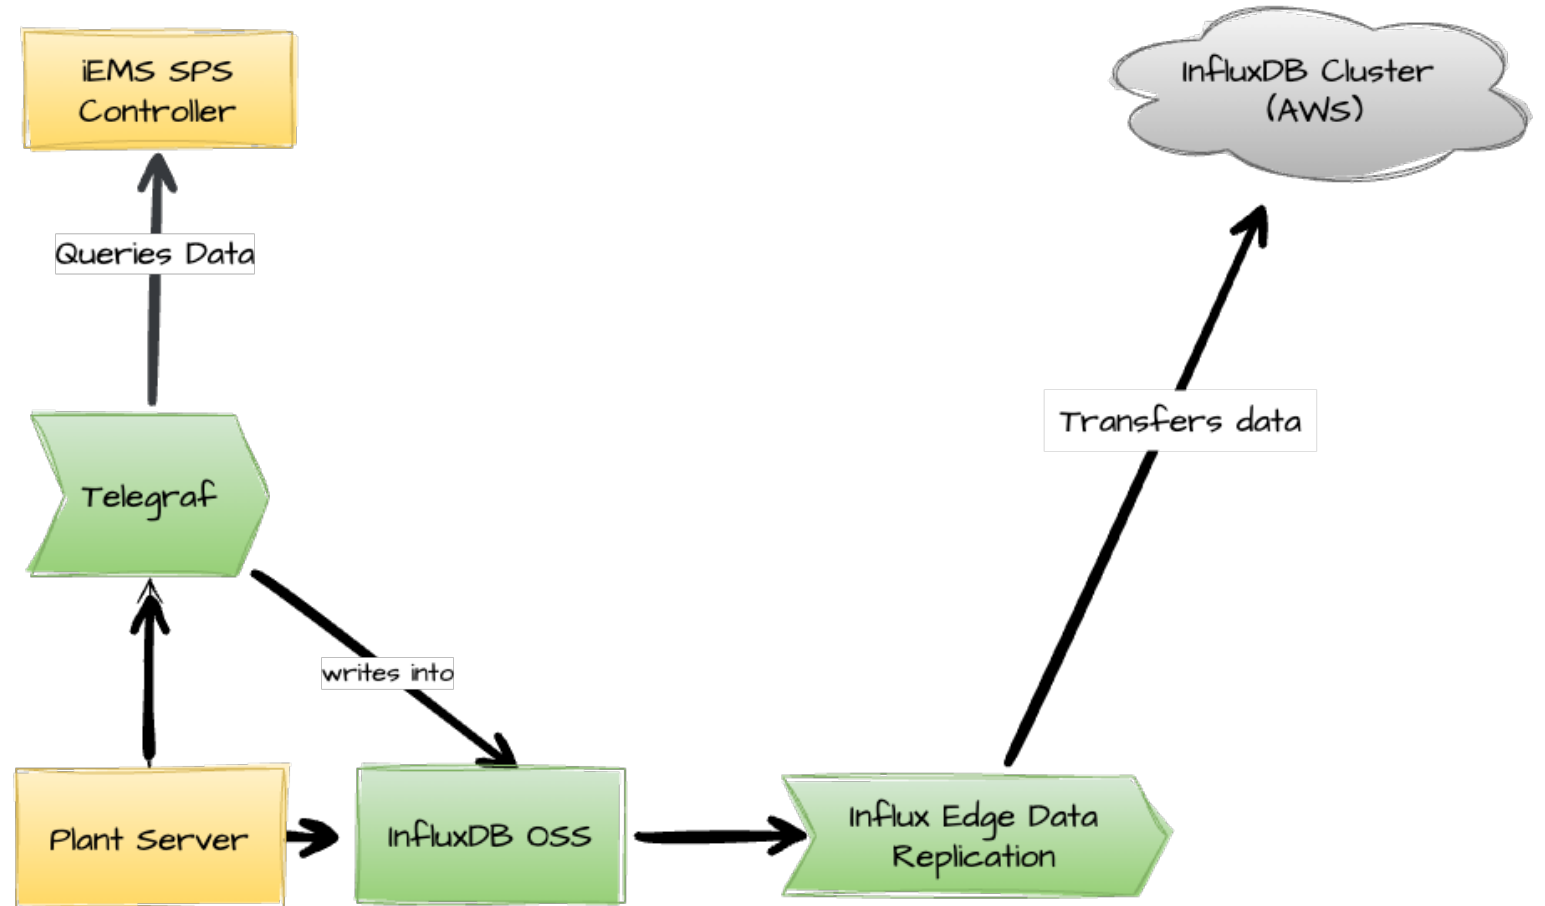

# Architecture Overview

## Local Plant setup

- Each plant has local servers running influxDB OSS infrastructure
- Implementation of Telegraf to read Modbus data from devices directly
- Telegraf "no code" solution allows agile development and deployments
- InfluxDB EDR takes care of reliable sending of data to the cloud

# InfluxDB Solution Partner – B1-Systems

## About B1-Systems

B1 Systems is a worldwide operating provider of Consulting, Training, Managed Service & Support around Linux/Open Source with more than 150 employees

## Areas of expertise

- Container and Virtualization
- Public & Private Cloud
- High Availability Cluster
- Configuration & System Management
- Monitoring & Log Management

## Products

- Client, Display & Server Management

## Locations

- Rockolding
- Cologne
- Berlin
- Dresden
- Jena

# Telegraf.conf file for getting the job done

## Telegraf Setup

- Define Modbus Input Plugins
- Define Modbus registers for each sector of the plant
- Configure InfluxDB Output Plugin
- Configure – depending on plant size – multiple telegraf.conf files to allow parallel data querying
- **“No Code” solution without dependencies for modifications unlike SPS**

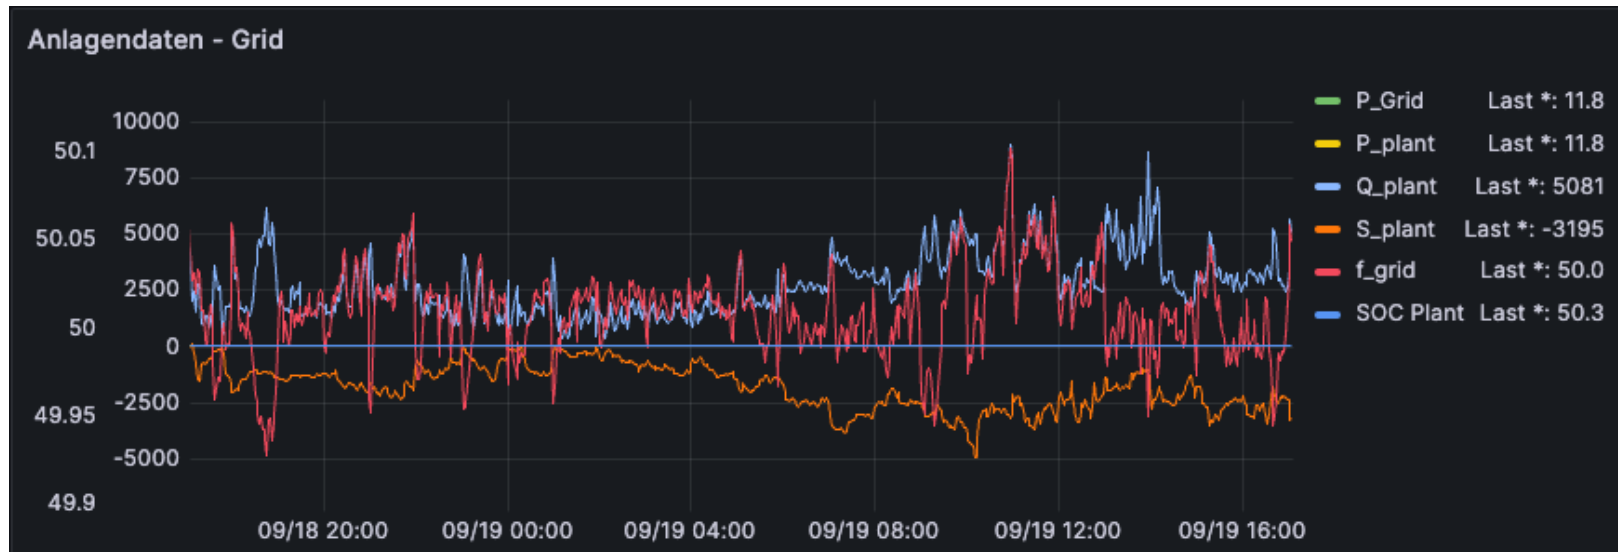

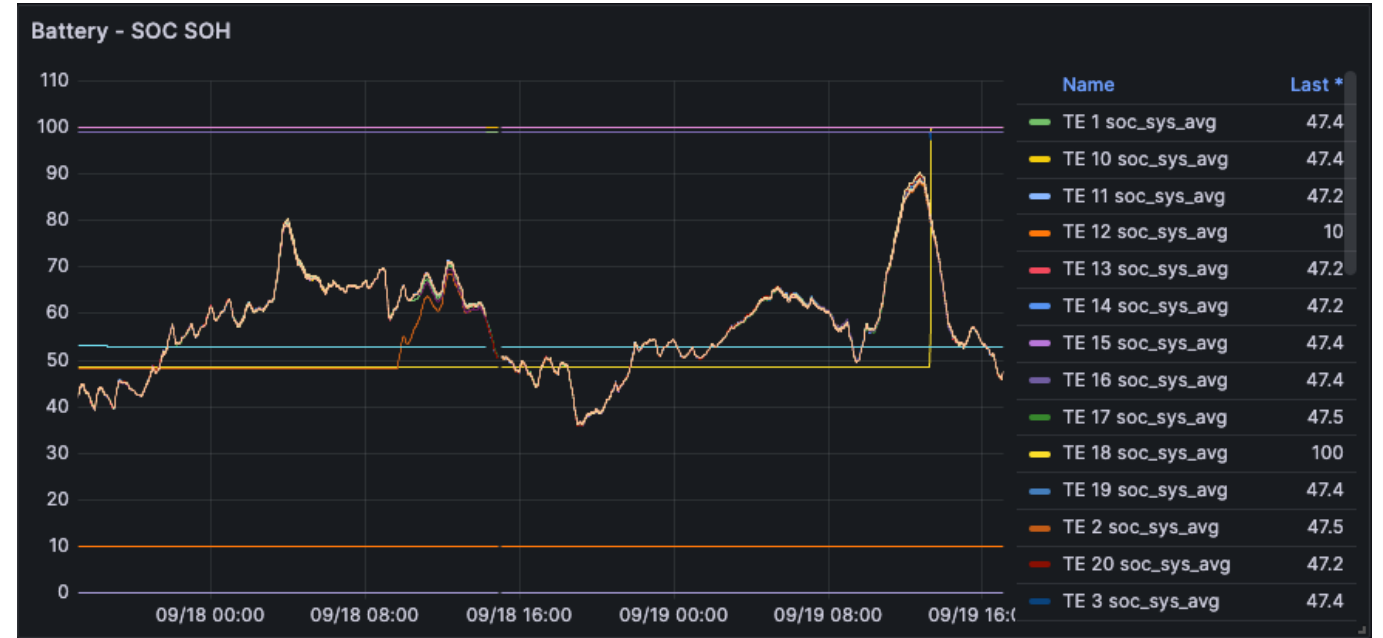

```
smareg_conf > SMAREG4 > telegraf.conf
50 configuration_type = "request"
51
52 [[inputs.modbus.request]]
53     slave_id = 1
54     optimization = "aggressive"
55     #optimization_max_register_fill = 50
56     byte_order = "ABCD"
57     register = "input"
58
59     fields = [
60         { measurement = "Anlagendaten", name = "p_plant", type = "UINT32", scale=0.00000001, address = 10},
61         { measurement = "Anlagendaten", name = "u1_2", type = "FLOAT32", scale=1.0, address = 12},
62         { measurement = "Anlagendaten", name = "u1_3", type = "FLOAT32", scale=1.0, address = 14},
63         { measurement = "Anlagendaten", name = "u2_3", type = "FLOAT32", scale=1.0, address = 16},
64         { measurement = "Anlagendaten", name = "i1", type = "FLOAT32", scale=1.0, address = 18},
65         { measurement = "Anlagendaten", name = "i2", type = "FLOAT32", scale=1.0, address = 20},
66         { measurement = "Anlagendaten", name = "i3", type = "FLOAT32", scale=1.0, address = 22},
67         { measurement = "Anlagendaten", name = "f_grid", type = "FLOAT32", scale=1.0, address = 24},
68         { measurement = "Anlagendaten", name = "s_plant", type = "FLOAT32", scale=1.0, address = 26},
69         { measurement = "Anlagendaten", name = "q_plant", type = "FLOAT32", scale=1.0, address = 28},
70         { measurement = "Anlagendaten", name = "p_grid", type = "UINT32", scale=0.00000001, address = 30},
71         { measurement = "Anlagendaten", name = "soc_plant", type = "FLOAT32", scale=0.1, address = 32},

74         { measurement = "Anlagendaten", name = "t_it_cab", type = "UINT8L", scale=0.1, address = 38},
```

# Grafana Visualization of BESS

## Grafana Visualization

- Adding variables which allows flexible investigation of data
- No performance issues – if you check one battery or twenty
- Dashboards can be used for automated reporting
- Standardized dashboards allow quicker deployments and connecting new projects into the monitoring

# Improving the Alert mechanism for both Generation BESS Systems

## **Grafana Multi-Dimensional Alerts**

- Allows complex alert conditions based on multiple metrics
- Supports time-based conditions (e.g., alert if SOC < 20 for 15 mins)
- Provides greater context, reducing false positives

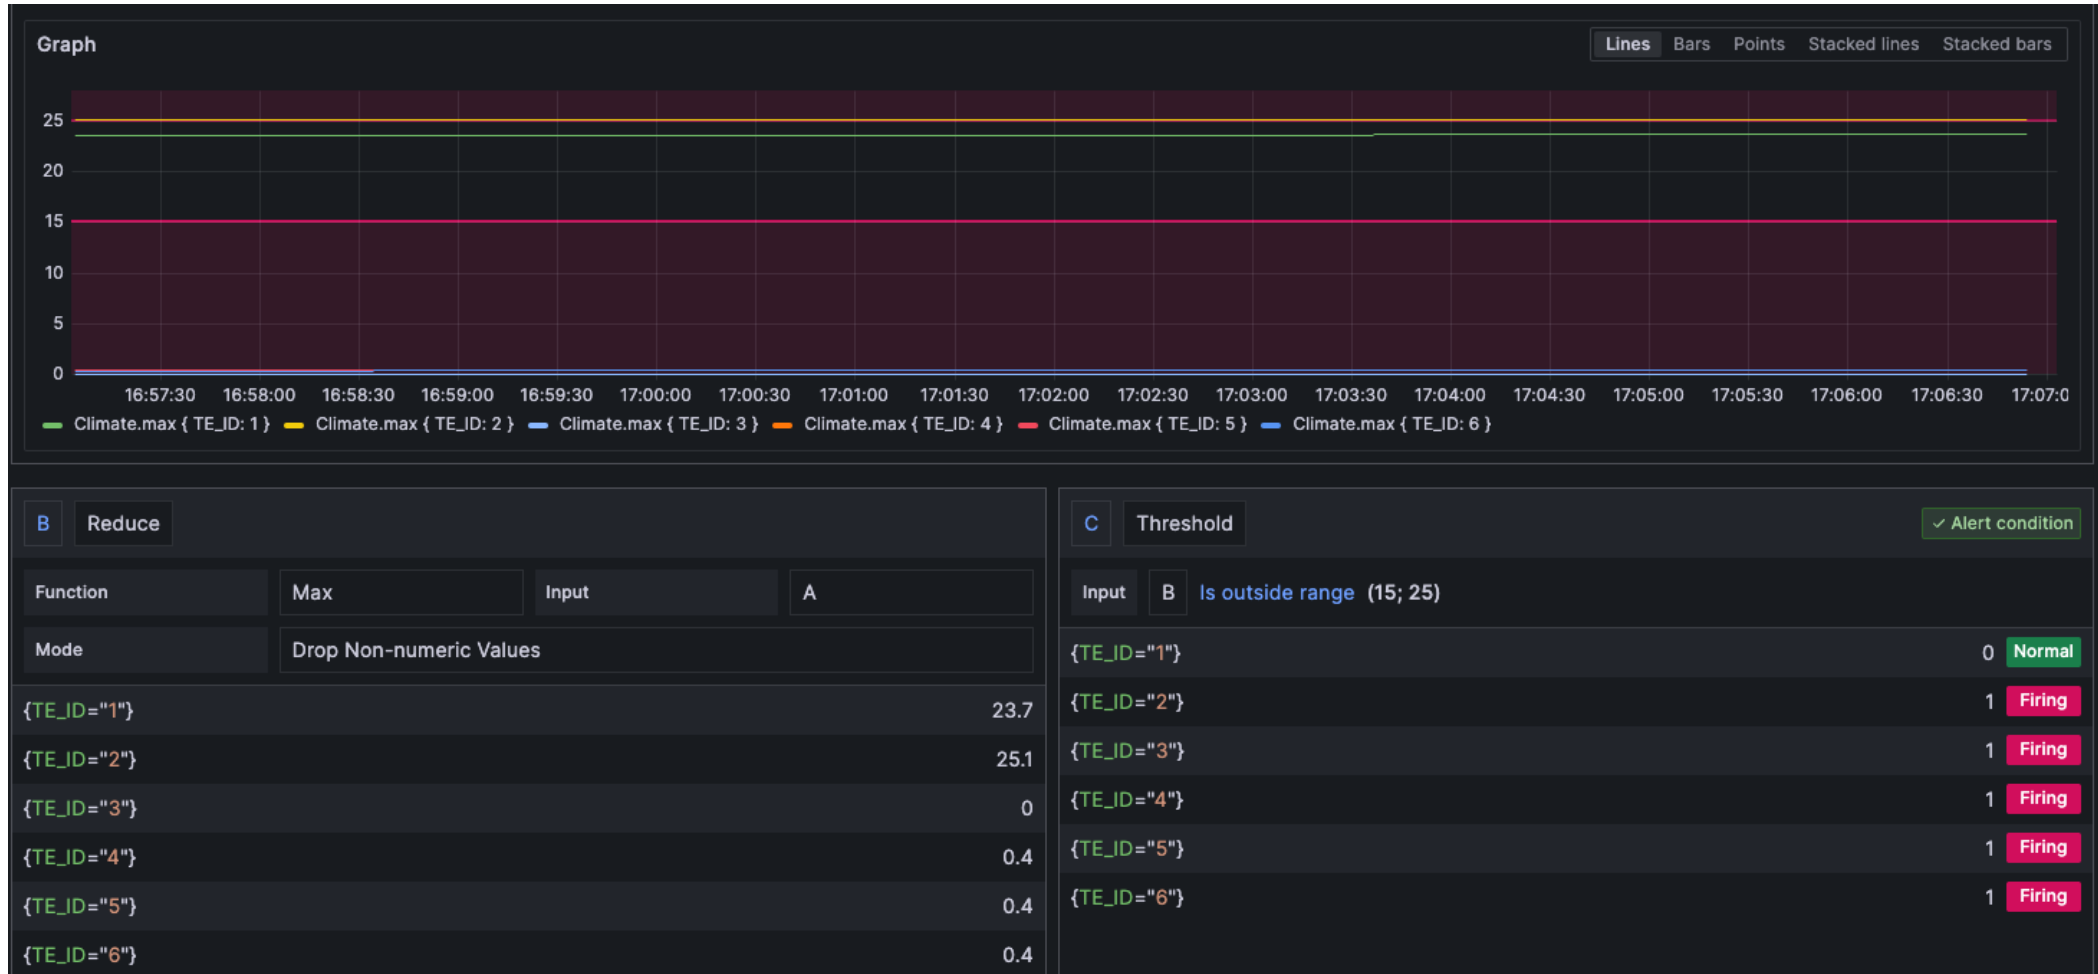

## **Sending Grafana Alerts Through Opsgenie**

- Direct Integration of Grafana Alerts with Jira Ticket System
- Allows on-call scheduling and routing rules
- Allows additional notification in case of emergency, i.e. via SMS and phone call

## **Creating Jira Tickets via Opsgenie**

- Auto-generate Jira tickets for specific alert conditions
- Streamlines incident management workflow

# Grafana Alerts

# Grafana Visualization of BESS

## Grafana Visualization

- LIVE DEMONSTRATION – SWITCH TO BROWSER AND CONTINUE HERE LATER

## Summary and next projects/steps

### Getting Data with Telegraf

- Telegraf supports wide range of devices and communication protocols
- Allows easy integration – like influxDB Database – “no need to think about it twice”
- Supported and integrated in a wide range of products, i.e. our firewalls have a Telegraf plugin

### InfluxDB Edge Data Replication

- Makes sending data stable even with unreliable network connections
- Reliable re-sending of failed metrics

### InfluxDB Cloud Dedicated

- (Nearly) no need to think about storage costs and usage anymore
- Way better compression compared to influxDB Cloud V1 or OSS

### Next projects and steps

- Evaluating communication between our SPS controllers and Telegraf with OPA-UA
- Evaluating communication between our SPS controllers and Telegraf with MQTT
- Integration of EPEX SPOT data
- Centralised cluster for analytics between batteries and market data

Wanna shape the

# energy transition

We take responsibility for our actions, ask questions, even the uncomfortable ones, and courageously try out new approaches.

Where you can

# get involved

Interested in pushing our shiny new InfluxDB Cloud Cluster to the max? Let's sit down for a coffee and discuss your path to joining the ju:niz team. 😊

We're hiring like crazy – not limited to IT jobs! Find out about your next big move at ju:niz. 🚀
